

NICKY HAWKINS · PAINTER & DECORATOR

NH Estimator User Manual

A pocket guide to the paint-estimating app, from first measure to final invoice — measuring rooms, staircases and exteriors, pricing wallpaper and kitchen resprays, quoting through Xero, scheduling, and running the job on site.

App version 2.69.4 · Manual generated September 2026
Screenshots taken from the app with example data

NH Estimator is a phone-first web app for pricing decorating work. You walk round the property measuring up, and the app turns those measurements into a fully priced quote — labour, materials, markup, deposit and payment plan — which you can send straight into Xero. Once a quote is accepted, the same app schedules the job, tracks the materials and time you actually use on site, and builds the final invoice back into Xero when you're done.

This manual follows the life of a job in order: **set up → measure → quote → schedule → on site → invoice**. If you're brand new, read [Getting started](#) and [Measuring up](#) first — the rest will make sense as you need it.

1. Getting started

Your first half hour, in order: install it on your phone → put your own name on it → connect Xero → check your rates → start your first job. That's the whole setup. Everything after section 1 you can read as you need it.

Install it on your phone

The app lives at its own web address — if someone set this copy up for you, that link is the one they sent you. It's designed to be **installed to your home screen** so it opens full-screen like a normal app:

- **iPhone:** open the app in Safari → tap the Share button → **Add to Home Screen**.
- **Android:** open it in Chrome → menu (⋮) → **Add to Home screen / Install app**.

If your copy of the app has a password set, you'll be asked for it the first time you open the app on a device — **once per phone, and then not again**. The sign-in refreshes itself every time you use the app, so it only ever comes back if you go a full month without opening it, get a new phone, or clear the browser's data. Let your phone save the password to iCloud Keychain (or your password manager) on that first login and even those rare times are a Face ID tap rather than typing.

Setting a password is worth doing now that you can send clients an approval link: the link points at the same web address the app runs on, so a client who trimmed it back to the domain would otherwise land on your jobs. With a password set they get a sign-in screen and nothing else. If there's no password on your instance, guard the web address like you would any private page.

Make it yours

Do this before you send anything to a client. Until you enter your own details the app falls back to the name and logo it was built with, so a quote, a snag-list PDF or even your sign-in screen could go to a client with somebody else's business on it.

Menu (≡) → **Settings** → **Business**:

- **Business name** — replaces that fallback everywhere it appears.
- **Logo** — optional, and shown *instead of* the name in the header when you set one. Leave it empty and your business name is used on its own.

Between them they carry through to the app header, the sign-in screen, the top of every quote you send and its PDF, the snag-list PDF and your calendar feed. To check it landed, open any job and tap **Quote** ↑ — what you see there is what the client sees.

Connect Xero (one-off)

Almost everything works without Xero, but quoting and invoicing shine with it connected:

1. Open the menu (≡) → **Settings**.
2. Scroll to **Xero Integration** → tap **Connect Xero** and sign in.
3. Back in Settings, under **Materials (Xero Items)**, tap **Refresh from Xero** to pull in your paint products, then pick your default products (wall paint, ceiling, woodwork, primer, mist coat, masonry...). Every new room starts with these defaults, so set them once and forget them.
4. If you plan to record deposits through the app (see [Recording a deposit](#)), also pick a bank account under **Settings → Deposits (Xero)**.

Check your rates

The app ships with sensible defaults (day rate £300, 20% markup, 25% deposit, standard coverage rates), split across two screens off the menu: **Rates** holds the calculation tables, **Settings** holds everything else. Skim through both once and adjust anything that doesn't match how you price — every figure in a quote comes from these numbers.

Your first job

There's nothing to create before you can start measuring: the app opens on a starter job called **My Job**, and Measure, On Site and Summary are already pointed at it. Give it the real name before you go any further, though — a job's name is what you'll be searching for months later.

Menu (≡) → **Jobs** → tap the  on *My Job* and type the client's address or job name over it. From then on  on that same screen starts each new job. The one you're working on is marked **CURRENT**; Rates and Settings are global and apply to every job. There's more on all of it in [Jobs](#).

Then open  **Measure** and put a room in it — [Measuring up](#) picks up from there.

2. Finding your way around

The **Home** screen is your morning glance: the current job and its status, a **Materials to buy** count, **Next on site** — the client you're due at next and the date — and shortcut links. When something needs chasing — a quote that's gone unanswered too long, a finished job you haven't invoiced — it appears at the top of Home as an attention strip.

The **bottom bar** is always visible and follows the life of a job, left to right:

Tab	What it's for
 Home	Dashboard and reminders
 Measure	Everything measured for the current job — rooms, exterior items, kitchen, fitted units and custom lines
 On Site	Time, materials and variations while the job runs
 Summary	The priced quote, Xero, and job status

The **menu** (≡), top right on most screens, holds every other screen:

Item	What it's for
Jobs	Switch jobs, start a new one, import a pre-app Xero quote
Colours	Every surface's colour, decided or not, and paint-ordering quantities
 Price Lookup	A till-check: search any Xero sales item for its price
 Shopping List	A running pick-up list, separate from any one job
Schedule	The job calendar
Rates	Every number behind a calculated price
Settings	Business details, Xero, backup, appearance

Below those, **↶ Undo** appears whenever there's a recent change on the current job you can undo (see [Materials & Undo](#)), followed by the sync line — "All changes synced ✓" means everything you've entered is safely on the server — and the build number, so you can confirm a deploy has actually reached your phone. Everything saves automatically as you type; there is no save button to forget.

3. Measuring up

Open  **Measure**. This screen lists everything measured for the current job — **Interior** rooms, **Exterior** items, the **Kitchen**, **Fitted Units** and **Custom Lines** — each showing its cost and estimated days at a glance. The figures on this screen are your *labour cost before markup* (the banner at the top says so); the chip in the top bar shows the customer-facing quote total, and Summary has the full customer-facing breakdown.

Tap the  **button** (bottom right) and choose what you're adding:

Quick add: walking a big house? Tap **Quick add** instead and just type the room names one after another — Living Room, Hall, Bedroom 1... — then go back round measuring each one on a second pass. Much faster than filling in a full form in every doorway.

Bulk edit

Once there's more than one room, **Bulk edit** appears on the Interior header. Tap it and every room gets a tick box — pick the ones you want (or **Select all**), then **Edit N rooms**:

The panel that opens covers the fields worth doing in one go: a product and colour band for each of the seven paint roles (walls, ceiling, woodwork topcoat, woodwork primer — with a **None** option for a self-priming topcoat — mist coat, feature wall and panelling), coat counts for walls/ceiling/woodwork/doors/frames, a mist coat toggle for walls and ceiling, and the room's prep level (which covers doors and frames too):

Cancel Preview changes

Every field starts on "No change" and stays there unless you set it — nothing carries over from the last time you used it, and a field you don't touch is left alone on every room. Two rules worth knowing: it **never invents a surface a room hasn't got** (ask for woodwork coats and a room with no woodwork is skipped, marked N/A in the preview), and **mist coat only ever adds** — ticking a surface turns it on where it's off, but leaving it unticked never turns an existing mist coat off. Coats work the other way and the form says so: the number you type is the exact coat count, not an increase.

Tap **Preview changes** to see exactly what would move, room by room, old → new, before anything is written:

REVIEW CHANGES Back

2 of 2 selected rooms will change. Nothing is written until you tap Apply.

Living Room
Wall coats: 2 → 3
Mist coat — walls: off → on

Master Bedroom
Wall coats: 2 → 3
Mist coat — walls: off → on

Back Apply to 2 rooms

Nothing is saved until you tap **Apply**; **Back** returns to the panel with every field still set. Afterwards the rooms are ordinary rooms — open any one and edit it as normal, nothing is locked. Staircase/HSL rooms take part too, but only for the fields that actually move their price: door coats, frame coats and every product override apply normally, while wall/ceiling/woodwork coats, the mist toggles and the prep level are skipped (a staircase room's total is worked out and frozen when you save the staircase form itself — change those on the staircase form instead).

Rooms and fitted units can also be **duplicated** — tap the  icon on their card in the Measure list. Everything copies: dimensions, coats, prep, colours and products, dropped in right below the original as "(copy)". This is the fast way to do bedrooms 2/3/4, or two matching alcove units either side of a chimney breast — measure one, copy it, change a couple of numbers. A copy always starts its own client sign-off from Pending (it never inherits the original's ✓), and on an accepted job it arrives flagged as a variation, same as anything else added after acceptance.

Putting the list in order

You measure in the order you walk the house, and the room you remembered on the way out lands at the bottom of the list. **Reorder** — on the **Interior**, **Exterior**, **Fitted Units** and **Custom Lines** headers, once that section has more than one row — walks them into the order you actually want:

Tap it and every row swaps its cost for ▲▼ arrows; tap those to walk a row up or down. It's one mode for the whole screen — every section's link reads **Done** while it's on, and any of them turns it back off. A row only ever moves **within its own section** (a room never walks into the exterior list), and the sections themselves keep their order. While you're reordering, rows don't open when tapped and can't be swiped away, so nothing gets deleted or edited by a stray finger — and the arrow at the top of a list is greyed out because there's nothing above it.

The order you set is the order everything downstream reads: the Summary breakdown, the client-facing Quote view, the Xero quote, the CSV export and the final invoice. Each move saves as you make it, like any other change (offline included, queued until you're back in signal). Bulk edit and Reorder are one at a time — turning either on takes the other's link off the header until you're done.

BAY WINDOW & ALCOVE/DORMER

Home **Measure** **On Site** **Summary**

The form is in two halves, and it follows how you actually work: **walk the room** first — every card that asks you to look at something and count it — then **decide the scheme** once at the end, in the last three cards. Nothing makes you jump back and forth between measuring and pricing while you're stood there with a tape.

Every card is collapsed when the form opens, so what you see first is a short index of the room rather than a page to scroll past — tap a heading to open that card, tap it again to fold it away. The two exceptions are at the top: **Room Details** (the room name and the Staircase / HSL toggle) is always on screen, since you touch both on every room, and **Dimensions** starts open because you fill it in every time. Dimensions is still an ordinary section, so once you've measured you can collapse it too and keep the rest of the form in view.

Only the top matters for a basic room:

1. **Room Name** — e.g. "Living Room".
2. **Dimensions** — pick the **Room shape** first:
 - **Standard** — length × width × height, for a plain rectangular room (the default).

- **Perimeter** — type the wall perimeter and ceiling height directly, plus the ceiling area, when the footprint doesn't reduce to L×W.
- **Segments** — build the room from rectangular zones (each L×W) that sum into the wall run and ceiling area — made for L-shapes and rooms with big alcoves.

In any mode, the **Bay Window & Alcove/Dormer** add-ons cover the common awkward bits: bay window extra perimeter, alcove/dormer wall and ceiling area, and a sloped-ceiling toggle (type the measured ceiling area directly, since a slope makes length × width wrong). So loft rooms and bays no longer need fudged numbers. (The **Staircase / HSL** toggle above swaps this card for staircase geometry — see [Staircases](#) below.)

The screenshot shows the 'Edit Room' interface with a 'Save' button at the top right. Below the title bar, there is a note: '— e.g. the two legs of an L-shape, or main room + alcove. Walls and ceiling both sum across zones'. The interface includes two zones for measurement: Zone 1 (3.2 x 4) and Zone 2 (2.1 x 1.8). Below these, it shows calculated values: Wall perimeter (22.2 lm) and Ceiling area (16.58 m²). There is a '+ Add zone' button. A 'Ceiling height' field is set to 2.4 metres. A 'Sloped ceiling' toggle is currently off, with a note: 'Slope makes length × width wrong — type the measured ceiling area instead'. At the bottom, there are four expandable sections: 'BAY WINDOW & ALCOVE/DORMER', 'DOORS & FRAMES', 'EXTRAS', and 'FEATURE WALL'. The bottom navigation bar has four icons: Home, Measure, On Site, and Summary.

Walk the room

The rest of the measuring cards follow in the order you'd meet them moving round the room — all optional, all collapsed until you tap them, and you skip whatever the room hasn't got:

- **Doors & Frames** — doors and their frames are priced as separate line items, each with its own quantity and coats:

The screenshot shows the 'Edit Room' interface with a 'Save' button at the top right. It contains two main sections: 'DOOR' and 'FRAME'. Each section has a 'Qty' input field set to '2' and a 'Coats' input field with a dropdown menu showing '0', '1', '2' (selected), and '3'. Below these are several toggle switches for additional options: 'Both sides' (Price the whole leaf (both faces) in this qty — off prices just the side visible from this room), 'Fire door (FD30/FD60)' (Intumescent-compatible coating surcharge; includes edges in the coat/coverage calc), 'Self-priming paint' (Skips the primer coat, adds one extra topcoat instead — set per product in Rates → Paint Coverage once the woodwork paint has an entry there), 'Remove & refit ironmongery' (Handles/hinges/locks taken off and refitted), and 'Mask ironmongery in place' (Cheaper than removing — mutually exclusive with removing).

Leave a Door or Frame's quantity at 0 to price just the other one. Their prep comes from the room's **Preparation** card — there's one prep decision per room, not a separate one here. Per line you'll also find **Fire door** (an FD30/FD60 intumescent-compatible surcharge, edges included in the coverage calc), **ironmongery** (remove-and-refit, or mask-in-place — mutually exclusive), **Self-priming paint** (skips the primer coat for one extra topcoat instead — once the paint has a Coverage Rates entry in Rates with Self-priming set, that entry takes over and this toggle is replaced by a note), and **Both sides** (price the whole leaf as one line instead of just the face seen from this room — handy for a door between two painted rooms, split one face each).

- **Extras** — windows (m²), window sills and radiators. Each adds its own time and paint.
- **Feature Wall** — one wall in a different finish: paint, or wallpaper (standard, wide vinyl or mural).
- **Wallpaper** — lining and finish paper for walls or ceiling, priced per roll with an automatic **rolls-to-order** count, plus a free-text note for the paper itself. Covered in detail in [Wallpaper](#) below.

- **Excluded Walls** — walls you're *not* painting (a tiled wall, wallpaper that's staying). Add its width × height and it's deducted.
- **Panelling** — wall panelling by area with its own coats (up to 4), prep and colour, independent of the room's own settings. Leave a wall's **-m²** chip on when the panelling sits on the room's own walls: its area comes off the painted walls *and* the wallpapered walls, so you can paper a room and paint its panelling without paying for either twice. For half-height panelling enter just the panelled part — the wall above keeps its paint or paper.

PANELLING

PANELLING
each wall as its own width × height, up to 4 coats; leave empty to skip. -m² takes that wall's area off the room walls so it isn't also priced as wall paint or hung with wallpaper — for half-height panelling enter just the panelled portion and the wall above stays in the room colour (or paper, as shorter drops). Skirt paints that wall's skirting with the panelling — it comes off the room's woodwork and is priced as panelling

Wall 1	-m²	Skirt	3.67	×	1.2	2	×
Wall 2	-m²	Skirt	3.34	×	1.2	2	×
Deducted from wall area						8.41 m²	
Skirting painted with panelling						3.67 m	

+ Add panelling wall

The **Skirt** chip is for skirting painted in the panelling's paint and colour, which it usually is. With it on, that wall's skirting comes off the room's woodwork (both the time and the woodwork paint) and is priced as part of the panelling instead: the wall's width × a 0.15 m skirting board, at the panelling's coats, time rate and prep, out of the panelling tin.

Skirting painted with panelling under the rows shows how many metres have moved, and on Summary the room's line reads **Panelling (incl. skirting)**. Both chips start on for a new wall; tap **Skirt** off where the skirting is a different colour and it stays with the rest of the woodwork. Rooms saved before this chip existed keep their skirting as woodwork until you tap it on. It works on staircase rooms too.

- **Mist Coat** — for fresh plaster; tick walls and/or ceiling, with a manual area override for "only part of it is new plaster".

Decide the scheme

Once you've stopped measuring, the last three cards are the pricing decisions — made once, with the room already captured:

- **Coats** — walls, ceiling and woodwork each default to 2. Set any of them to 0 to skip that surface entirely (e.g. ceiling not being painted). Below the coat counts sit three independent **spray toggles** — one per surface:

The screenshot shows the 'Edit Room' screen with a 'Save' button at the top right. The main content area has three sections for 'Walls', 'Ceiling', and 'Woodwork'. Each section has a coat count selector (0, 1, 2, 3) and a 'Spray' toggle. The 'Spray walls' toggle is off, while 'Spray ceiling' and 'Spray woodwork' are on. Below these are three expandable sections: 'PREPARATION', 'PAINT & COLOUR', and 'PREVIEW'. The 'PREVIEW' section shows 'Wall area' as 38.16 m². At the bottom is a navigation bar with icons for Home, Measure, On Site, and Summary.

Spray walls is off by default (also adds the spray sundries bump for the extra masking); **Spray ceiling** and **Spray woodwork** are on by default, since ceilings and woodwork are normally sprayed. A surface's toggle adds the Rates spraying uplift % to its litres on top of the standard or per-product rate — labour time is unchanged either way.

- **Preparation** — Minimal / Standard / Heavy, or a custom percentage. This scales labour across the whole room, doors and frames included. **Making Good** adds a fixed £ amount for repairs.
- **Paint & Colour** — each surface takes your default product from Settings; override the product or colour band here when a room is different. The **colour** itself is a free-text box per surface (walls, ceiling, woodwork, and again on Feature Wall and Panelling), pre-filled with where it goes — leave it as it is and decide later. See [Colours](#).

Two cards at the bottom sum up what you've entered:

- **Preview** — the live estimated cost and time, updating as you type.
- **Paint Needed** — how many litres this room takes, per surface, at your coverage rates (with each surface's spray uplift already included, rounded up to the half litre):

The screenshot shows the 'Edit Room' screen in a mobile app. At the top, there's a back arrow, the title 'Edit Room', and a 'Save' button. Below this are two toggle switches: 'Remove & refit ironmongery' (with subtext 'Handles/hinges/locks taken off and refitted') and 'Mask ironmongery in place' (with subtext 'Cheaper than removing — mutually exclusive with removing'). A series of expandable sections follow: 'EXTRAS', 'WALLPAPER', 'MIST COAT', 'PANELLING', 'PREPARATION', and 'PAINT & COLOUR'. At the bottom is a 'PREVIEW' section containing a table with the following data:

PREVIEW	
Wall area	39.24 m ²
Ceiling area	21.32 m ²
Estimated cost	6624.02

At the very bottom is a navigation bar with four icons: 'Home' (house), 'Measure' (triangle), 'On Site' (wrench), and 'Summary' (clipboard).

These are the same figures Summary's materials list buys from — a feature wall in the room's own colour and product folds into the Walls line rather than getting its own row, since that's one tin of paint bought once.

Staircases (Hall, Stairs & Landing)

Stairwells are the hardest thing to measure by hand — big raking walls you can't get a tape across, hall and landing running into each other. The app does the geometry for you. Click the **Staircase / HSL** toggle at the top of the room form and the Dimensions card is replaced with staircase geometry:

Add Room Save

 how many sides get painted 1 **2**

Home Measure On Site Summary

Work down the cards:

1. **Number of Floors** — 1, 2 or 3 including the ground floor. A typical two-storey house is **2**: ground-floor hall, one staircase, first-floor landing. Choose 3 and a second staircase and landing appear.
2. **Ground Floor Hall** — plain length × width × height, like any room.
3. **Staircase 1** — this is where the app earns its keep:

The screenshot shows the 'Add Room' screen in the NH Estimator app. At the top, there is a back arrow, the title 'Add Room', and a 'Save' button. The screen is divided into two main sections: 'Stair walls' and '1ST FLOOR LANDING'.

Stair walls section:

- Stair walls:** how many sides get painted. A toggle switch is set to '1' (with '2' also visible).
- Steps:** count as you go up. Value: 13.
- Stair width:** metres — physical width of the stairs. Value: 0.9.
- Wall height at bottom:** metres. Value: 2.4.
- Riser:** default 220mm. Value: 0.22.
- Tread:** default 220mm. Value: 0.22.
- Top step:** metres — measure at the top, see diagram. Value: 0.25.

1ST FLOOR LANDING section:

- Length:** metres. Value: 3.0.
- Width:** metres. Value: 1.9.
- Height:** metres. Value: 2.4.

At the bottom, there is a navigation bar with four icons: Home (house icon), Measure (triangle icon), On Site (wrench icon), and Summary (clipboard icon).

- **Stair walls** — how many sides of the staircase get painted (1 or 2).
- **Steps** — count them as you go up.
- **Stair width** — the physical width of the stairs.
- **Wall height at bottom** — floor to ceiling at the foot of the stairs.
- **Riser** and **Tread** — pre-filled with the standard 220 mm; only touch these on an unusual staircase.
- **Top step** — the one measurement people get wrong, so it has its own diagram:

WALL 1 — Large raking stair wall: DERIVE the width, MEASURE the heights

Width is built UP from the bottom (hall + steps), NOT measured across the top — the upstairs landing length overlaps the stairwell void and double-counts. This avoids that error.

The trick, as the diagram shows, is that the big raking stair wall's width is **derived, never measured**: hall width + (steps × going) + top step. Measuring across the top instead double-counts the stairwell void; measuring along the bottom is impossible because the stairs are in the way. You measure only the easy things — heights straight up with a laser — and the app builds the wall from the step geometry.

4. **1st Floor Landing** (and 2nd, for three floors) — plain length × width × height again.
5. **Staircase Details** — spindles, newel posts and their woodwork coats. These are priced per piece, with their own timings editable under Rates → Time Rates.

The **Staircase Areas** card at the bottom shows its working — so you can see exactly what you're pricing and sanity-check it against the space you're standing in:

On Site

Summary

Here the derived stair wall width is 5.01 m (1.9 m hall + 13 steps × 0.22 m + 0.25 m top step), giving 13.23 m² of raking stair wall on top of the hall's 29.28 m² and the landing's 23.52 m² — a 66 m² job in total, priced at 2.74 days, without a tape measure going anywhere near the stairwell.

Wallpaper & rolls to order

Any room (including a staircase) can have wallpaper on the walls, the ceiling, or both. Open the **Wallpaper** section of the room form:

The screenshot shows the 'Edit Room' screen of an app. At the top, there's a back arrow and 'Edit Room' text, and a 'Save' button. Below is a 'Pattern / product note' section with a text area containing 'Cole & Son W' and a small explanatory text. This is followed by 'Walls' with a note and two buttons: 'Lining' and 'Finish'. Then, 'Wall wallpaper labour' is shown with a value of '£780.00'. The 'Rolls to order' section has a note. Below are 'Roll length' (10.05) and 'Roll width' (0.53) fields. 'Pattern match' has three buttons: 'No match', 'Straight' (selected), and 'Offset'. 'Pattern repeat' is set to 32. 'Spare roll' has a toggle switch turned on. At the bottom, 'Drop length' shows 'Lining 2.50 m · Finish 2.82 m' and 'Drops per roll / needed' shows 'Lining 4 / 33 · Finish 3 / 33'. A bottom navigation bar has icons for Home, Measure, On Site, and Summary.

- **Pattern / product note** — free text at the top of the card, for whatever you'll want to know later: the pattern name, the supplier, "paste-the-wall", "heavy vinyl, needs a seam roller". Write it while you're stood in the room looking at the paper, and it's there when you come to order or come back to the job. It's **your note, not the client's** — it never appears on the client quote, the Xero quote or the Colours screen, and it doesn't affect a single figure. Optional; leave it blank if the paper is unremarkable.
- **Lining / Finish** — tap either or both. Both on means "line out, then hang finish paper", and each is priced separately per roll (rates in Rates → Wallpaper Rates). The labour appears immediately.
- **Roll length / Roll width** — pre-filled with the standard 10.05 m × 0.53 m; check the label of the actual paper and adjust.
- **Pattern match** — *No match* (lining papers, plains), *Straight* or *Offset*. A pattern match wastes paper, and the calculation accounts for it.
- **Pattern repeat** — in cm, straight off the roll label.
- **Spare roll** — adds one extra to the order, just in case.

Below the inputs the app shows its working, batch-book style: the **drop length** (wall height plus trim allowance, lengthened to allow for the pattern repeat when there's a match), **drops per roll / drops needed**, and the bottom line — **Rolls to order**. Read that to the client off

your phone.

The screenshot shows the 'Edit Room' interface of a mobile app. At the top, there's a back arrow, the title 'Edit Room', and a 'Save' button. Below this is a 'Pattern match' section with three tabs: 'No match', 'Straight' (which is selected), and 'Offset'. The 'Pattern repeat' section shows a value of 32 cm, with a note 'cm — off the roll label'. The 'Spare roll' section has a toggle switch turned on, with the text 'order one extra, just in case'. The 'Drop length' section shows 'Lining 2.50 m · Finish 2.82 m'. The 'Drops per roll / needed' section shows 'Lining 4 / 33 · Finish 3 / 33'. The 'Rolls to order' section shows 'Lining 10 · Finish 12'. The 'Ceiling' section has a note 'both can be on — e.g. line out then finish' and two tabs: 'Lining' and 'Finish'. Below these are four expandable sections: 'EXCLUDED WALLS', 'PANELLING', 'MIST COAT', and 'COATS', each with a right-pointing arrow. At the bottom is a navigation bar with four icons: a house for 'Home', a triangle for 'Measure', a wrench and screwdriver for 'On Site', and a clipboard for 'Summary'.

Two things worth knowing:

- The rolls figure is a **buying guide, not a charge** — the labour feeds the quote; the client buys the paper — and the app deliberately doesn't supply it.
- On a staircase/HSL room, wallpaper labour automatically picks up the **staircase multiplier**. Ceilings get their own multiplier the same way.
- **Panelling comes off the paper.** Any Panelling wall with its **—m²** chip on is taken out of the wall paper: a full-height panelled wall loses its drops altogether, and half-height panelling (wainscoting) leaves shorter drops above it, which the count cuts from the offcuts left on your rolls. Turn the chip off for panelling that isn't on the papered walls (a bath panel, boxing-in). Staircase rooms don't do this yet — their paper is still worked out from the full stair walls.

Besides the standard roll calculation above, two other wallpaper types are available (feature wall only, under Rates → Wallpaper Rates for pricing): **Wide Vinyl** (commercial 137 cm material, priced per metre/area) and **Mural** (printed to the wall size, priced per m² or a flat fee).

Home Measure On Site Summary

Exterior work is priced per *item* — typically one per elevation ("Front elevation", "Rear + gable") or per job type ("Fascias all round"). Each item is a menu of exterior work; fill in only what applies:

- **Masonry / Render** — area in m² and coats, with toggles for **textured render** (more paint, more time) and **spray render**.
- **Fascias & Soffits** — linear metres and coats.
- **Exterior Windows** — one row per matching group, with panes-per-window and a size band.
- **Exterior Doors & Frames** — same fire-door/ironmongery/self-priming options as interior doors, split the same way.
- **Garage Doors, Porch / Feature Door** — priced in days.
- **Sash Window Restoration** — prime & paint plus resin repairs, reglazing, draught-proofing, cords and beads, added per window.
- **Preparation** and **Making Good** — same idea as rooms.
- **Paint Colours** — one masonry colour and one exterior woodwork colour per item, in the same free-text boxes the rooms use.

Access uplifts for 1st floor and 2nd floor+ work are applied per item automatically; the percentages live in Rates. Exterior paint litres are estimated from assumed areas per unit (window, sash, door, garage, fascia width) — calibrate these in **Rates → Exterior Paint Coverage & Areas** as real jobs prove them out.

Site notes

Tap the  **button** (bottom left of Measure) any time to jot job notes — access arrangements, things agreed on the doorstep, snags you spotted. Notes save automatically and stay with the job.

4. Kitchen cabinet respray

On **Measure**, tap **+** → **Kitchen** to open the dedicated cabinet-spray calculator — one kitchen per job, saved automatically. Once it has anything in it, the kitchen appears as its own priced line in the Measure list and the quote.

The screenshot shows the 'Kitchen' calculator interface. At the top, there's a back arrow, the title 'Kitchen', a quote value of '£1,589.28 quote', a green status dot, and a menu icon. Below this are several sections: 'COATS' with a sub-note '— applies to every item below' and a 'Coat count' selector set to '2'; 'FACES' with a sub-note '— applies to every counted item below' and a toggle for 'Outside faces only' (currently off); 'PREP' with a sub-note '— applies to every counted item below' and a toggle for 'Strip original coating' (currently off). Below these are item count sections: 'DOORS' (10), 'DRAWER FRONTS' (5), 'END PANELS' (2), and 'FILLERS' (empty). At the bottom is a 'LINEAR ITEMS' section with a sub-note '— priced per metre, not per piece'. The bottom navigation bar has four icons: Home, Measure (active), On Site, and Summary.

- **Coat count** (1–4) applies to every item below.
- Tap open **Doors**, **Drawer Fronts**, **End Panels** and **Fillers** and enter how many of each size (Small / Medium / Large / X-Large). Each size has its own base price and per-coat price — tune them in Rates → Kitchen Rates. Each card shows its piece count on the header once collapsed, so you can shut them all and tally the kitchen at a glance.
- **Linear items** — cornices and plinths are priced per metre.
- **Carcass spraying** — toggle on to add a percentage uplift for spraying the cabinet interiors/carcasses.
- **Colour & Product** — pick the paint for the quote and materials list.

Two cards sit above the item counts and apply across everything below them:

The screenshot shows the 'Kitchen' configuration screen in the NH Estimator app. At the top, there's a back arrow, the title 'Kitchen', a quote value of '£938.28', a green status dot, and a menu icon. The main content area is divided into several sections:

- COATS**: A section header with a sub-note '— applies to every item below'. It contains a 'Coat count' slider set to 2, with options 1, 2, 3, and 4.
- FACES**: A section header with a sub-note '— applies to every counted item below'. It contains a toggle for 'Outside faces only' (currently turned on) and a descriptive text: 'Only the front of each piece is sprayed — halves doors, drawer fronts, end panels & fillers. Carcass spraying, cornices/plinths and stripping are unaffected'.
- PREP**: A section header with a sub-note '— applies to every counted item below'. It contains a toggle for 'Strip original coating' (currently turned off) and a descriptive text: 'Melamine/existing coating removal before spraying — adds prep time per item, based on the counts below'.
- DOORS**: A count of 10 with a right arrow.
- DRAWER FRONTS**: A count of 5 with a right arrow.
- END PANELS**: A count of 2 with a right arrow.
- FILLERS**: A right arrow.
- LINEAR ITEMS**: A section header with a sub-note '— priced per metre, not per piece'.

At the bottom, there's a navigation bar with four icons and labels: 'Home' (house icon), 'Measure' (ruler icon), 'On Site' (wrench icon), and 'Summary' (clipboard icon).

- **Outside faces only** — for jobs where only the fronts are being sprayed. Turn it on and doors, drawer fronts, end panels and fillers are all priced at **half** — the per-piece prices in Rates are whole-piece, both-faces figures, so half is one face. Carcass spraying, cornices/plinths and stripping deliberately stay at full price (the carcasses are the same surface either way; trim has one face to begin with), and the client's quote line reads "outside faces only" so the scope limit is on their copy too. Off by default, so nothing you've already quoted changes.
- **Strip original coating** — for spraying over melamine. Adds stripping time to every piece counted, at your day rate, worked out from the counts already entered — the line beneath the toggle shows the sum it priced so you can check it before it lands in the total. Off by default and the minutes-per-size are editable under Rates → Kitchen Rates.

5. Fitted units

+ → **Fitted Unit** on Measure — for bespoke built-ins: a bookcase or media unit with open shelving above and cabinet doors below. You can add several to one job, each auto-named "Fitted Unit N" (rename it — "Left alcove", "Media wall unit" — so multiple units read apart on the quote, materials and client view).

The screenshot shows the 'Fitted Unit' form in the NH Estimator app. The form is titled 'Fitted Unit' with a back arrow and a quote value of £357.43. It contains the following fields:

- UNIT** — open shelving & cabinet doors, priced per shelf/bay/door
- Name** — shown on the quote breakdown, materials & client view — e.g. "Left alcove" (Value: Alcove 5)
- Bays** — vertical sections (Value: 3)
- Height per bay** — m — one shared height for every bay (fitted units are near-always a single consistent height — say if a per-bay height is ever needed). With depth & the bay widths below, drives the paint litres only (Value: 2.1)
- Depth** — m — internal carcass depth, front to back, shared by every bay. Litres then use the real painted area per bay (back + both sides + top & bottom) and per shelf (top & underside), instead of the old flat guesses (Value: 0.35)
- Bay 1 width** — m (Value: 0.6)
- Bay 2 width** — m (Value: 1.2)
- Bay 3 width** — m (Value: 0.6)
- Shelves** — total across all bays, fixed area

The bottom navigation bar shows Home, Measure, On Site, and Summary.

Unlike the kitchen calculator's flat £ pricing, a fitted unit is priced in **minutes**, like rooms and doors, so it stacks properly into the day-rate maths:

- **Bays, Height per bay, Depth** — one shared height and depth for the whole unit (fitted units are near-always a consistent height); a width input appears per bay, so uneven layouts (a wide TV recess between narrower shelf bays) are no problem.
- **Shelves** — total across all bays, priced as a fixed spray time each (top, underside and front edge in one unit).
- **Cabinet doors** — priced at the interior door rate, **one face** by default (a built-in is normally painted from the front only). **Door size** scales this for cupboard-size ($\frac{1}{2}$) or wardrobe-size ($1\frac{1}{2} \times$) doors, and **Both sides** prices the whole leaf — doubling that unit's

door labour and litres — for units sprayed inside and out. Shelves and bay carcasses are unaffected by either.

- **Prep Level** — Bare/Primed (full prime + 2 coats) or Existing painted (light key-sand + topcoat, no primer bought).
- **Sprayed finish** — off by default; adds the Rates spraying uplift to the litres.
- **Complexity/Masking** — None / +10% / +20%, for recessed lighting, tight bays or electrics to mask off. Stacks on labour time before markup, same shape as the Commercial toggle.
- **Colour & Product** — defaults to your Settings woodwork topcoat.

The **Breakdown** card shows the priced result before markup, same as a room's Preview.

6. Custom line items

+ → **Custom line** on Measure — for one-off items that don't fit any pricing model: "Install panelling — £450", or "Extra sheet of ply — £40 × 2".

The screenshot shows the 'Add Custom Line' screen in the NH Estimator app. At the top, there is a back arrow and the title 'Add Custom Line', with a 'Save' button in the top right corner. Below the title, a section labeled 'CUSTOM LINE' with a subtitle '— manual description & price, no calculation behind it' contains the following fields:

- Description:** A text input field with the placeholder 'e.g. Install panelling to hallway' and a button labeled 'Install pane'.
- Unit price:** A text input field with the placeholder '£ ex VAT, entered directly' and a value of '450'.
- Quantity:** A text input field with the placeholder 'default 1' and a value of '1'.
- Line total (ex markup):** A text input field showing the calculated total as '£450.00'.

Below the 'CUSTOM LINE' section is a 'MARKUP' section with a toggle switch labeled 'Apply markup'. The toggle is currently turned on. Below the toggle, there is explanatory text: 'On = joins the quote's commercial/markup calculation like any other line. Off = the price above goes on the quote exactly as entered (margin already baked in)'.

At the bottom of the screen is a navigation bar with four icons and labels: 'Home' (house icon), 'Measure' (ruler icon), 'On Site' (wrench and screwdriver icon), and 'Summary' (clipboard icon).

Type a **Description**, a **Unit price** (ex VAT) and an optional **Quantity** (default 1). The **Apply markup** toggle decides how it behaves on the quote: on (the default) joins the commercial/markup calculation like any other line; off, the price goes onto the quote *exactly* as entered — for ad-hoc prices that already have your margin baked in. Custom lines sit in their own section on Measure with a MANUAL tag so they never read as a calculation, are fully editable and swipe-deletable, and flow through to the Summary breakdown, the client-facing Quote view, the Xero quote and the final invoice. No sundries % is added to them either way.

7. Colours

You never have to decide a colour to finish a measure. Every painted surface starts out named after where it is — "Lounge Feature Wall", "Bedroom 1 Main Walls" — so a colour you haven't discussed yet still reads as something you recognise weeks later, instead of as "Colour 3". When the client makes their mind up, you type the real name over the top. Same box, same place, whenever it happens.

Each surface's colour is one free-text field, on the room form under **Paint & Colour** and again on this screen. Type into it and the built-in library of nearly 1,450 colours (Farrow & Ball, Little Greene, Dulux, Dulux Heritage, Paint & Paper Library, RAL Classic, Lick and COAT) autocompletes as you go, filling in the brand and code the merchant needs. The search reads the **brand** as well as the name, so typing "lick" or "coat" shows you what they do; for the brands whose colours are described rather than numbered it reads the description too, so "charcoal" brings up COAT's The Coal Drop and "anthracite" brings up RAL 7016. Eight matches show at a time, best first. Under each name you get the brand, plus its **No.** where the brand issues one (Farrow & Ball No. 28) or the shade in words where it doesn't (COAT · Charcoal Grey). A colour that isn't in the library is fine as free text, and can be saved to the library for next time — including the same name under a second brand.

Under the field are **quick-pick chips**: every other colour already on this job, one tap each. That's how a colour used in two places gets shared, so the job buys one tin between them rather than two. Typing the same name twice does the same thing — the second one joins the first rather than making a duplicate.

Menu (≡) → **Colours** is the job-wide view of all of it:

Colours by area lists every painted surface in the job, room by room, each with the same editable field and marked **Named** or **To decide** — so you can see at a glance what's still open and settle any of it from one screen. It's somewhere to look, not a step you have to complete.

Below that, **What to buy** is the ordering view, unchanged: each colour, the rooms and surfaces it covers, and **how much paint to order** — the same calculation Summary uses, so the two can never disagree. Look here, not at Summary, when you're actually buying paint.

Naming a shared colour only changes the one you're on. If six surfaces are all on the same undecided colour and you name one of them, that surface gets a colour of its own and the other five stay as they were — the field says so underneath while it's shared. To put them all on it, tap its quick-pick chip on each, or just type the name again.

8. Price Lookup & Shopping List

Two small tools off the menu, independent of any one job.

 **Price Lookup** searches every sales item in your Xero account by name or code and shows what it actually costs at the till — your **buy** price from Xero, inc VAT, with the ex-VAT figure underneath, which is the number printed on the supplier's price list. It is not your sell price: that has your markup on it, and belongs on quotes, not at the counter. An item with no buy price in Xero says **no buy price** rather than showing £0.00. It's a read-only till check, not tied to any quote:

Tap the + on a result to add it straight to your Shopping List.

 **Shopping List** is a persistent, global pick-up list — not scoped to any one job, so a shop run can buy for whatever's on:

Items arrive from Price Lookup, or type one straight in ("masking tape") for anything that isn't a Xero item. They can also come off a job: tap  **Add to list** on any materials row on **On Site**, or on a materials row on **Summary** — see [Putting materials on the shopping list](#). Tick items off as you buy them and **Clear ticked** to reset for next time; items added from a job's materials carry that job's name as a tag, so the list says why something's on it.

9. The quote (Summary)

Open  **Summary** and the job becomes a priced quote:

The hero card shows the **total quote**, days on site, and the markup applied. Below it:

- **Labour** (before markup) and **On Site days** at a glance.
- **Imported from Xero (pre-app quote)** — a toggle for jobs originally agreed directly in Xero before this app existed. Turn it on to honour that agreed labour figure as-is instead of the app's own room calculation; materials still come from Measure as normal. It only applies to a handful of jobs, so it isn't shown on every one: it appears automatically on any job already using it and on any job brought in by **Import an accepted quote from Xero**. On an ordinary job you'll see a single line, "**Labour agreed in a pre-app Xero quote?**", in its place — tap that and the toggle appears. Leave it off for anything measured and priced in the app.
- **Commercial job** — a toggle that adds a percentage uplift (default 10%) before markup, for commercial rather than domestic work.

- **Standalone job** — for a job booked on its own, where 1.6 calculated days still blocks out 2 diary days: this toggle charges labour at whole diary days × your day rate (rounding up to a full or half day, per the setting in Rates). It never discounts — if the calculated labour already beats the rounded figure, nothing changes. Both figures stay visible on the quote maths, and the top-up flows through markup, deposit, Xero and the final invoice like any other labour. A job can be commercial, standalone, both or neither.
- **Markup / Discount** — this quote can override your default markup; enter a negative number for a discount.

Scroll further for the full breakdown — every room, exterior item, kitchen, fitted unit and custom line priced, labour subtotal, sundries, markup — followed by the **Materials** list: each paint totalled in litres and converted into tins to buy.

Materials list **one line per product and tin size**, the way On Site has always shown them, with the surfaces that line's tins are for underneath it: *"Lounge Main Walls · 2 · Bedroom 1 Main Walls · 1"*. The same paint in two rooms is one line of three tins, not two lines you can't tell apart. Once every colour on a line has a real name, the name replaces the generic colour band inside the product itself — *"Tikkurila Optiva 5 - Colours 3ltr"* becomes *"Tikkurila Optiva 5 - Farrow & Ball No. 28 Dead Salmon 3ltr"* — on Summary, on the client's quote and in Xero, exactly as it already reads on an invoice. Until then the line keeps the generic wording and the surfaces underneath say what it's for. Editing a quantity on one of these rows takes the change off the **largest colour first**, and never leaves a colour holding no paint at all — a wall missing off the shopping list costs you a second trip, a spare tin doesn't. When the colour you wanted cut isn't the one it chose, **tap the surfaces line** under the product (it reads ► ... · *set each*) to open a **box per colour** and set them yourself; the row also opens itself straight after you type a total, so you can always see which colours it landed on. Type a total lower than the number of colours on the row and it holds at one each and says so, rather than deciding for you which wall goes unpainted — put **0** in a colour's own box to go below that. Deleting a row deletes that product, every colour of it.

Materials & Undo

Materials are quoted as an estimate and — once the job runs — invoiced as used, so the list on Summary and On Site is the same list throughout a job's life. **Add Material** searches your Xero items (or free-text) for anything the calculation missed — an exterior plastic door, a kitchen, anything you've deleted the calculated line for and are entering by hand. Manually-added lines carry a **Chargeable** switch which is **on by default**, so what you add is on the quote, in the Materials subtotal and in the deposit like any other material. Turn it **off** to keep a line as tracking-only: it stays on your shopping list but is left out of the total, and the card then says how much is sitting there — *"Tracking only — not on the quote"* under the subtotal — so nothing is ever quietly missing off a price. A row you've already added shows **Chargeable** or **Tracking only** as a tag; tap the tag to switch it. **Recalculate** re-pulls the calculated lines from the rooms without throwing away your own additions: anything you added yourself is kept and tagged **"added by you"**, a quantity you've typed over is kept and tagged **"edited"** (with a **reset to N** link if you want the calculation's figure back), and if recalculating would drop something you edited by hand, you're asked first, by name.

Almost anything you do to the materials list — recalculating, deleting a line, changing a quantity, adding a line — can be undone. Look for an **UNDO** button on the confirmation message right after the change, ↩ **Undo** at the top of the Materials list, or ↩ **Undo** in the ≡ menu if you missed the moment. It remembers the last 10 changes on the current job; switching job or closing the app starts it fresh.

Once a quote is accepted, its figures freeze

Everything in this app is calculated from your current Rates and Settings — right up until a client says yes. The moment a quote is **Accepted**, the app takes one snapshot of every figure — every room's price, the materials, the totals — and from then on the client-facing views read that frozen record, not a fresh recalculation. So nudging a coverage rate or a day rate next month can't silently move the price on a job someone already agreed to.

Summary still shows the live calculation underneath, because that is how you price an amendment and how you spot that your rates have moved since. A single rule marks where one ends and the other begins — **"Working figures — today's rates. Everything below this line is the live calculation, not what the client agreed."** Everything above it (the accepted-quote card, the total, the Labour figure, the deposit) is the agreed record; the **Room Breakdown** and **Materials** below it are today's maths on the same job — the breakdown because it is where a variation added after acceptance shows up, and where a room's days and per-surface detail live, and the materials list because it is the shopping list and you buy at today's prices. The **Cost Summary** card doesn't appear on an accepted job at all: it is the pre-markup working of a quote that has been superseded, and sitting under the accepted total it only ever read as that total's breakdown.

If the live figure has moved away from the agreed one, the strap-line under the total says so — *"Same job priced today: £X — £Y more, broken down below"* — and a **Where the £Y difference is** card sits directly underneath telling you exactly where it went: labour agreed → today, materials agreed → today, the £5 rounding on its own line, and then **which lines moved** — room by room, biggest mover first, with anything added since acceptance marked as such. Underneath that it says whether the Rates page had anything to do with it. Only the settings that actually price a job are checked (the rates, the coverage table, the kitchen rates, the product choices), so exporting a backup or changing a payment plan never reads as a rate change. It also checks **the app's own version**: the rates are only half of what prices a job, and an update that changes how a room is costed will move a frozen quote's live figure with nothing on the job touched. Where the build has changed since you accepted, the card names both versions, so an unexplained few pounds has an explanation instead of looking like the app inventing money. None of it changes the agreed figures; **Amend** is still the only thing that does.

Measure

On Site

Summary

For the same reason the **Commercial job**, **Standalone job** and **Markup / Discount** controls stop taking taps once a job is accepted — they can't move a price that is already agreed. A strip above them says so, with **Unlock for amending** if you do want to change one: unlocking affects the working figures and whatever you freeze as the next revision, never the total already agreed.

If the job genuinely needs to change after acceptance — a variation, a correction — Summary shows the current **Accepted quote — Revision N** and an **Amend → revision N+1** link, which re-runs the calculation once and freezes a new snapshot. The old revision stays on record; nothing is overwritten. Once there is more than one, a **History (N revisions)** link appears next to it: tap it for the list of every revision with its date, its total and what each amendment added or took off.

Client-facing quote view

Quote ↑ (top bar, next to **Export ↓**) opens a branded, read-only one-page quote at customer-facing prices — room by room, colour schedule, payment terms and total, with your logo and business colours. It opens inside the app; tap **Save PDF** and it builds a real PDF file (as many pages as it needs) and hands it to your phone's share sheet — save it, email it straight to the

client, or send it to a printer. It works with no signal, so you can produce a quote PDF standing in a house with no bars. It's regenerated live every time you open it, so it never shows stale figures, and doesn't touch Xero at all.

Recording a deposit

Once the job is **Accepted**, the status card carries the deposit line — unless you've turned off **Deposit required** (its own toggle, default on, for jobs that don't want one: a client who always pays, work squeezed in around a bigger job).

The screenshot shows the 'Summary' screen of the NH Estimator app. At the top, there are tabs for 'Summary', 'Quote', and 'Export'. Below the tabs, a green checkmark indicates the job is 'Accepted' on 8/27/2026, with a 'Mark Completed' button and a 'Move to Draft' link. A calendar icon shows the job starts on Monday, 7 Sept, and ends on Friday, 11 Sept, with a 'Reschedule' or 'Unschedule' option. The 'Received' section shows a pre-filled amount of 1198.75 and a date of 08/27/2026. Below this is a 'Note (option)' field with a placeholder text: 'Plan says £1,198.75 — record what was actually paid, not what should have been.' At the bottom of this section are 'Save deposit' and 'Cancel' buttons. A green-bordered box contains 'Agreed figures — revision 1' with a note that figures are frozen at acceptance and a link to 'Amend — revision 2'. The bottom section, titled 'ACCEPTED QUOTE — REVISION 1', contains a table for 'LABOUR' with three items: Living Room (£761.38), Master Bedroom (£541.89), and Front elevation exterior (£801.15). The bottom navigation bar has icons for Home, Measure, On Site, and Summary.

ACCEPTED QUOTE — REVISION 1	
LABOUR	
Living Room	£761.38
Master Bedroom	£541.89
Front elevation exterior	£801.15

1. **Record deposit** > — the amount is pre-filled from the quote's deposit figure; correct it to what was really paid, set the date the money arrived (matching your bank feed), add a note if you like, **Save deposit**.
2. **Sync to Xero** — creates it in Xero as Receive Money → Received as Prepayment, against the bank account chosen in Settings. **Don't also enter it in Xero yourself** — doing both double-counts the money against your bank feed.
3. **Apply it to the invoice in Xero** when you raise the invoice, exactly as before — the app can't do this step, since Xero won't let a payment be applied to a still-draft invoice.

The line then shows where things stand — *not in Xero yet*, *in Xero · unallocated*, or *in Xero · allocated ✓* — read back from Xero, which stays the boss: void or delete the deposit there and the app notices and stops saying it's synced. A failed sync loses nothing — the deposit stays recorded, the line turns red with the reason, and **Try again** is safe. Fixing a mistake (a typo, a refund) is done in Xero, not here — the app never edits or deletes a deposit that's already landed.

The quote description

Under the breakdown sits the **Quote description** — the wording that rides the **first line item** on the Xero quote, and describes that line. It's written for you from the job: the app picks the wording template that fits the work (Painting, Wallpapering, Kitchen Cabinet Spraying and so on — all editable in **Settings → Quote & Invoice Text**), fills in your products and coats, and puts it in future tense for a quote and past tense for the final invoice.

A job with **both rooms and exterior items** gets the **Interior & Exterior** template, which has an INSIDE half and an OUTSIDE half — so a client reads the promise about their furniture and flooring *and* the one about their windows, doors and landscaping, instead of only the indoor one.

It says what you actually measured. Quote only the walls and it won't promise ceilings and woodwork. Measure a feature wall, panelling, radiators, window sills or a mist coat on new plaster and each one gets named — with its own product if you gave it one:

Ceilings finished in Tikkurila Anti Reflex 2, walls in Tikkurila Optiva 5, the feature wall in Farrow & Ball Estate Emulsion, and all woodwork including skirtings, window sills and radiators in Tikkurila Helmi 30, each applied in 2 coats. Newly plastered walls will be mist coated prior to finishing.

A papered feature wall isn't listed as painted — it moves to the wallpapering line instead, which names what's being papered.

It never states a paint the job doesn't use. It's a whole-job sentence, so woodwork measured in one room puts woodwork in the wording for the job — and where the rooms use *different* paints on the same surface, every one of them is named rather than whichever room came first:

Ceilings finished in Tikkurila Anti Reflex 2, walls in Tikkurila Optiva 5 and Dulux Diamond Matt, and all woodwork including skirtings in Tikkurila Helmi 30, each applied in 2 coats.

Only rooms that actually paint a surface get a say — an old product left on a room with no wall coats doesn't count as a second paint — and a surface no room paints at all keeps your Settings default. Coats work differently, because there's nothing to list: where the surfaces disagree, no coat figure is stated rather than a wrong one. Type the detail into the box yourself whenever you'd rather spell out which room gets which.

It describes one line, and every other line says what *it* is having. Each Xero line carries its own price, so the block opens *"Painting of Lounge:"* and describes the Lounge — not a list of every room in the job on a line priced for one of them. The protection and completion paragraphs are true of every room, so they appear once and the later lines just point back at them:

Lounge	Painting of Lounge: [protection · the Lounge's scope · completion]
Kitchen	same as above
Bedroom 1	same as above
Bathroom	Ceilings finished in Tikkurila Anti Reflex 2 and walls in Tikkurila Optiva 5, each applied in 2 coats. Preparation and completion as above.
W.C.	Walls in Tikkurila Optiva 5, applied in 2 coats. Preparation and completion as above.

"Same as above" now means exactly that — same as the first line. A room matching it collapses, so identical bedrooms stay tidy and the detail appears only where a room genuinely differs. Your own client quote view gets the short version under each room name: *"ceiling, walls and woodwork", "walls"*.

The box is editable: type in it and your version sticks from then on (↵ **Reset to template** goes back). **Editing it also turns the per-room lines off** — once the wording is yours, the app stops adding sentences underneath it that you didn't write and can't edit; every other line goes back to "same as above". Sending stamps the exact wording onto the quote, so a document you've already sent never changes underneath you. Sending doesn't count as editing, though — **Update quote in Xero** keeps each room's own lines exactly as the first send wrote them.

Exterior items get the same treatment, from what you measured on them — render (textured or not), fascias and soffits, windows, sash windows, doors, garage doors, a porch — with repairs and restoration noted where you've logged any. Each exterior line compares against the other *exterior* lines, so it only carries text where it genuinely differs from them.

Fitted units describe themselves too — *"Fitted units including 3 bays, 9 shelves and 4 doors painted both sides in Tikkurila Helmi 30, applied in 2 coats. Bare surfaces will be primed first."* — with the product coming from the unit's own picker (or your Settings woodwork topcoat) and the priming note following each unit's **Bare / Already painted** setting. The **kitchen** fills in its coat count; its product and colour aren't tracked in the app, so those stay as [product] and [colour/finish] markers for you to type over, along with the fitted units' [spray/brush] and the wallpaper templates' [paper name/supplier] .

On the Xero quote, the kitchen and fitted-unit *lines* still read "same as above" under the block — only rooms and exterior items get a per-line scope sentence.

If you've edited your templates in Settings, your saved copies keep whatever wording you gave them. To pick this up, put `{surfaces}` where the scope sentence should go (and `{papered}` where a wallpapering line names what's being papered) — or use **Reset to defaults** to take the supplied templates back.

Sending to Xero

Expand the **client panel** at the top of Summary:

1. **Client name** — start typing and existing Xero contacts autocomplete; picking one fills phone, email and address into blank fields only (anything you've already typed wins). **Sync to Xero** pushes the app's details the other way.
2. **Street address** autocompletes as you type; picking a suggestion fills street, town and postcode.
3. Add a **Reference** if you use them.
4. Tap **Send to Xero**. The quote is created in Xero, ready to send to the client from there, and the job's status becomes **Quoted**.

If you edit the job afterwards, the button becomes "**Update quote Q-nnn in Xero**" so re-sending updates the *same* quote — with a "Send as a NEW quote instead" option when you genuinely want a second version. Answers given in Xero flow back into the app when you next open it; an answer given in the app always wins.

When the client answers

- **Mark Accepted** — the job moves to Accepted (synced to Xero), its figures freeze (see above), and scheduling and On Site tracking unlock.
- **Mark Declined** — the job files itself away under Declined.

Quotes that sit unanswered longer than your "chase quotes after" setting (default 14 days) pop up on Home so nothing slips.

10. Jobs

Menu (≡) → **Jobs**. The app holds any number of jobs; the one you're working on is marked **CURRENT**, and everything on Measure, Kitchen, Summary and On Site belongs to it. Tap another job to switch. Rates and Settings are global — they apply to every job.

- **The client's name is the top line** of each row, with the job name and its status underneath — job names repeat ("Bedrooms" three times over), people don't. A job with no client saved shows its name on top instead; the client comes from the **Client** details on Summary's Xero panel.
- **Search** (top of the screen) filters every group as you type: client name, job name, calendar title, or a Xero quote/invoice number off a piece of paper. Several words all have to match, but not in the same field — "priya bedrooms" finds it. A count and a **Clear** link sit under the box, and the search resets each time you open the screen.

- Jobs group by status: **Draft → Quoted → Accepted / Declined → Completed → Invoiced.**
- **+** starts a new job. renames one. duplicates a job as a quick template (notes aren't copied). Each job is fully separate — its own rooms, kitchen, colours and materials.
- **Import an accepted quote from Xero** — took the job on before the app existed? Import the Xero quote and it becomes a job here, with the agreed price as the record (adjustable via the **Agreed figures** card, or the **Imported from Xero** toggle on Summary — see [The quote](#)). If a listed quote actually belongs to a job already in the app, use **"Already a job in the app? Link it >"** instead of importing a duplicate.

11. Schedule

Menu (☰) → **Schedule** — or tap **Schedule** > on an accepted job's Summary, which offers the next free slot automatically.

- Switch between **List**, **Weeks** and **Month** views. Jobs appear as coloured bars across their booked days; UK bank holidays are marked, and weekends are greyed out unless you've turned on **Work Saturdays** in Rates → Scheduling.
- **Tap a job's bar** → Open job, **Move start date** (then tap the new day), or **Unschedule**.
- **Tap an empty day** → start a job there, or **block days** for holidays and time off.
- The header tells you your **next free day** at all times.
- **What a job is called on the calendar:** entries read **client — job name — calendar title**, skipping anything the others already say. So a Kitchen job for Lauren Lowe reads "Lauren Lowe — Kitchen" whether or not you typed a calendar title, and an older job still named "Lauren Lowe - Kitchen" doesn't say her name twice. The client comes from the job's **Client** details (Xero panel on Summary) — if a job has no client saved, the entry is just the job name.

Blocking days off

Holidays, a day at the dentist, a week's decorating on your own house — tap the day and the sheet opens with the day's own actions first:

- **Block day(s)...** is offered on **every day from today onwards** — including Saturdays, Sundays and bank holidays. Your usual week may have those off, but a job set to *+ Saturdays* or *Every day* works them, and a block is the one thing that override never beats. The picture above is exactly that: a Saturday in the middle of a whole-house job.
- It takes a range: the day you tapped → an end date (the same day, for a single day off), plus an optional label such as *Holiday*. The day you tapped is always blocked. Days merely swept up in between are blocked only if you'd have been working them anyway — a weekend in the middle of a fortnight off is already off, so it isn't cluttered with a chip, unless a job was booked across it.
- Blocked days draw as a dashed grey bar across the calendar, are never offered as a start date, and booked jobs stretch **around** them. Your phone calendar feed agrees, so a blocked fortnight is a gap there too.
- Tap a blocked day for **Unblock this day**, or **Unblock all N days** to clear the whole run in one go.

- **Start a job here** lists the accepted jobs still waiting for a date, four at a time — tap **N more waiting...** for the rest. Blocking stays at the top of the sheet however many are waiting.

A one-off day out of the ordinary, without changing anything globally: tap the day itself → **start a job here** (or move a job there), and the confirm tells you what switches on — a Saturday turns on "Saturdays for this job only", a Sunday or bank holiday turns on "Every day for this job only". From an accepted job's own **Schedule** > form, the same idea is the **Days worked** picker (Usual / + Saturdays / Every day), which switches itself if you pick such a start date. Automatic slot suggestions still only ever offer your usual working days, and your own blocked days always win.

See jobs in your phone calendar: Rates → Scheduling → turn on **Calendar feed**, then tap the link to copy it and subscribe in your calendar app. Booked jobs then appear alongside everything else in your life.

12. On Site — running the job

Once a job is accepted, the 🏠 **On Site** tab is your day-to-day companion:

The screenshot shows the 'On Site' mobile app interface for a job titled '24 Willow Road'. At the top, there's a header with 'On Site' and an 'Invoice >' button. Below the header, a card displays the job name, a green 'Accepted' status with a calendar icon, the date 'Mon, 7 Sept', and a '5d' duration. A green 'Mark Completed' button is on the right. Below this, a table shows financials: 'Estimated' at £0.00, 'Actual (so far)' at £0.00, and 'Variance' at £0.00, with a note 'Everything ticked off'. The 'TIME ON SITE' section shows 'No days logged yet · estimated ~13 on site' and a large blue '+ Log today (full day)' button, with a smaller 'Log a different day' link below. The 'MATERIALS' section states 'No materials yet. Recalculate the snapshot on Summary, or add what you bought below.' The 'ADD MATERIAL THE ESTIMATE MISSED' section has three input fields: 'Product' (optional, type to search) with a 'Search...' button, 'Description' (e.g. Extra r), and 'Colour' (optional) with a dropdown menu showing 'No colour'. At the bottom is a navigation bar with icons and labels for 'Home', 'Measure', 'On Site' (active), and 'Summary'.

- **Estimated vs Actual** — the card at the top tracks what the materials are really costing against what you quoted, with the variance.
- **Time on Site** — tap **+ Log today (full day)** at the end of each day (or *Log a different day* to back-fill). This builds the true labour record for the job.
- **Materials** — the quote's materials list becomes a shopping list. Tick items off as you buy them, and correct quantities/prices to what you actually paid — see [Materials & Undo](#) for how edits and Recalculate interact, and Undo if something goes wrong. Any row here can also go on your **Shopping List** — see below.
- **Add material the estimate missed** — extra sundries or a forgotten tin: search the product, set the price, done.
- **Variations** — the client asks for "just one more room" mid-job? Add the room (or exterior item, fitted unit) on Measure and flick its **Variation** toggle. It's priced with the same engine but kept separate from the accepted quote, and appears in its own Variations card here. Each variation carries a status — tap ✓ **Approved by client** to record their yes

(with an optional note; the date is stamped automatically), or mark one Declined to drop it from the totals and the final invoice while keeping the record. Anything still Pending gets called out before the final invoice will let it through.

- **Snags** — the punch list for the job, above everything else once there's something on it. See below.
- **Invoice** > (top right) shows the materials list formatted for invoicing, with a **Copy** button.

Putting materials on the shopping list

This is the screen you have open standing in the room, so it's the one that answers *"do I still need to buy this?"* — and every materials row carries a  **Add to list** chip, the quoted tins as well as the sundries you added yourself. Tap it and the product goes on your [Shopping List](#) with its price and this job's name, and the chip changes to ✓ **On list**:

The screenshot shows the 'On Site' app interface. At the top, there's a header with 'On Site' and an 'Invoice >' button. Below the header is a button '+ Log today (full day)' and a link 'Log a different day'. The main section is titled 'MATERIALS' and contains three items:

- ☐ **Dulux WS Gloss & UC – Brilliant White 5ltr**
Colour 1
Add to list
2 tins £156.14
- ☐ **Extra roller sleeves** not quoted
✓ On list
3 £13.50
- ☐ **Masking tape 50m** not quoted
Add to list
2 £6.40

Below the materials list is a section titled 'ADD MATERIAL THE ESTIMATE MISSED'. It contains a form with the following fields:

- Product: optional, type to search (with a 'Search...' button)
- Description: e.g. Extra r
- Colour: optional (with a dropdown menu showing 'No colour')
- Unit price: (partially visible)

At the bottom of the screen is a navigation bar with four icons: Home, Measure, On Site (active), and Summary.

It's per row and never automatic — plenty of what's on a job is already in the van. Summary's materials list has the same chip on the quoted lines, and either route lands on the same list: one line per product, no duplicates however many times you tap, and both job names on it if

two jobs need the same thing. Paint sold by the litre goes on **without a price**, because the figure on the row is a price per litre, not what a tin costs at the till. Ticked something off in the shop and then ran out? Tap the chip again and it goes back on the list.

Snags — the punch list

The last few days of a job are a list of small things: a scuff by the switch, a handle to refit, a staircase that wants one more coat. That list goes here, and On Site puts it above everything else while anything on it is still open.

- **The section only shows up when there's something to show.** No snags yet, and there's just a quiet + **Start a snag list** at the bottom of the screen. Tick the last one off and it drops back down there too, collapsed to **All n cleared** ✓ — tap it to reopen the record.
- **Grouped by room**, with that room's colours next to its name, read straight from the Colours tab — each surface named where they differ (*Walls Dead Salmon · Ceiling All White*), or just the colour where the whole room is one. So you don't have to leave the screen to find out what to open. Rooms the quote never priced — the airing cupboard, the garage step — can have snags too, and you can give those a colour by hand (see below).

- **Ticking one off doesn't remove it — it drops to the bottom.** The row goes struck through with the date you cleared it and stays on the list, which is the point: at the end of the job the list *is* the evidence of what got done. But it moves below everything still open in that room, so three weeks in, with thirty things ticked off, the handful you've still got to do are the ones at the top rather than scattered through them. A room where everything's cleared drops below the rooms that still have work in them, and the same rule applies in the **By phase** view. Untick anything you tick by mistake and it goes straight back up where it was.
- **Phase** on each row (the little dropdown) is the pass it belongs to — Prep, Stain block, Woodwork, Walls, Ceiling, Details, Final access. Set it and the room re-sorts itself into working order, with anything that blocks the space once it's done (floor cleans, stair recoats) last. Snags with no phase yet sit at the top of their room so they're not forgotten.
- **By room / By phase.** The toggle flattens the whole house into phase order instead — every stain-block job in the building together, so you get the stain block out once. Room order is what it opens on.
- **Every group folds.** Tap a room heading (or a phase heading in the other view) and its snags fold away, leaving the heading, its colours and its count — *2 open*, or *all done ✓*. Tap it again to open it back up. A room you've finished with is folded to start with, so a forty-snag house opens as the rooms that still have work in them. Once you've tapped a heading yourself your choice sticks for the rest of the visit — the app won't fold a room back up under you when you tick its last snag off. **Fold all** (beside the toggle) folds the lot in one go and turns into **Open all**. Folding rooms doesn't touch the **By phase** view, or the other way round, and none of it is remembered between visits.
- **PDF** (next to + **Add snag**) saves the list as it stands right now — see below.

The snag list as a PDF

PDF at the top of the Snags section builds a one-file copy of the list and hands it to your phone's share sheet, so it can go straight to the client, to whoever's working with you, or into an email as a record. On a computer it downloads instead. It's named for the job and the day you exported it (*NH-Snags-12-Ermine-Street-2026-09-04.pdf*), because a snag list moves — two exports a week apart *should* be two different files.

What's in it: your business name and logo at the top, the job, the client and the address, then **how many are outstanding and how many are cleared**, then the list room by room in the same order the screen is showing it — colours beside each room name, the phase against each snag, an empty box for anything still to do and a filled one, struck through and dated, for anything cleared.

It builds from what's on your phone, not from what's reached the server, so a snag you ticked in a cellar with no bars is already ticked in the file. It works with no signal at all. Once everything's cleared, **Export PDF** sits under the reopened list at the bottom of the screen — that copy is the completed punch list, which is the one worth sending on.

Adding snags

+ **Add snag** opens a sheet with two ways in.

One snag — pick the room (or **Custom...** and type a name), type the snag, set the phase if you know it. The sheet stays open on the same room afterwards, because snags come in runs.

Paste a list — for the list the client emails you, or the notes off your own phone. Paste it as it came: a line on its own is a room, and lines starting **-**, ***** or **1.** are the snags under it. **- []** and **- [x]** checkboxes are fine — **both come in as still to do**, because on someone else's list a tick means "I've flagged this", not "you've fixed it".

On Site Invoice > 12 Ermine Street

REVIEW SNAGS Back

5 snags in 2 rooms. Fix anything the paste got wrong before it is added — a sentence read as a room heading becomes an item with ↑ **item**.

Details x

ROOM ↑ item x

Landing

Walls Card Room Green · Ceiling All White · Woodwork Wimborne White

Recoat the handrail

Woodwork x

Stair treads — final coat, then keep off

Back Add 5 snags

Nothing is written until you've looked at it. The review sheet shows exactly what it made of the paste, and everything on it is editable: room names, the snags themselves, and the phase on each one (pasted snags start with none — the app never guesses a phase from the wording, because it would guess wrong). If a stray sentence got read as a room heading, ↑ **item** folds it back into the room above; × drops a line. Then **Add n snags**.

Colours on rooms you never measured

On a job that came in from Xero there are no measured rooms at all, so there's nothing for the snag headings to read a colour from. Any room heading with no measured room behind it gets a + **colour** tap instead:

Tap it and you get the same colour field as everywhere else in the app: start typing and your colour library offers matches with their brand and number, so "dead sal" finds Farrow & Ball No. 28 Dead Salmon and fills the rest in for you.

Under the field, the colours already on this job are one tap each. A name the library has never heard of is fine too — type it and it's yours; the dropdown also offers to **save it to your colour library** with a brand and code, so it's there for the next job. **Clear colour** puts a room back to undecided without losing the colour itself.

Rooms that aren't one colour. Most rooms aren't — the walls one thing, the ceiling another, the woodwork a third. Switch the sheet to **By surface** and you get a field each for walls, ceiling, woodwork, feature wall and panelling:

SNAGS (5) + Add snag

ROOM COLOUR Cancel

Master Bedroom

This room was never measured, so its colour lives with the snag list. It shows up on the Colours tab alongside the rest of the job.

Whole room By surface

WALLS

Dead Salmon

Farrow & Ball · No. 28 White All White

Wimborne White

CEILING

All White

Farrow & Ball · No. 2005 White Dead Salmon

Wimborne White

WOODWORK

Wimborne White

Farrow & Ball · No. 239 White Dead Salmon

All White

Clear colour Done

The heading then names each one — *Master Bedroom — Walls Dead Salmon · Ceiling All White · Woodwork Wimborne White* — and each surface shows up on the Colours tab in its own right, exactly as a measured room's would. **Whole room** and **By surface** are either/or: setting one clears the other, so a room only ever has one answer. Measured rooms already worked this way; this just brings the ones you never measured into line.

Once a room has a colour it shows on the heading (**Landing — Dead Salmon**) and joins the **Colours** tab alongside everything else, marked *from the snag list* so you can tell it apart from a room you measured. Rooms still waiting on one are listed there too, under **Snag rooms — no colour yet**, so you can work through them from either screen.

A room you *did* measure works the other way round, unchanged: its colour comes from the Colours tab and the snag heading just shows it. There's only ever one place a given room's colour is set.

Snags and signal

Snags sync exactly like the rest of On Site — tick things off in a house with no bars and every change queues on the phone and goes up when you're back in signal, same as your materials and your logged days. The sync dot in the corner counts them with everything else.

Let the client approve extras themselves

Under the Variations card, **Send for approval** creates a private web page for this job and puts the link on your clipboard — text it, WhatsApp it, or email it to the client.

They open it on their phone. No login, no app to install:

NH Estimator
Painting & Decorating

Quote for Mrs Fielding
14 Ermine Street

ORIGINAL QUOTE

As agreed **£4,250.00**

The price already agreed for the original scope of work. Unchanged.

EXTRAS SINCE THEN

Landing ceiling **£312.50**
✓ **Approved** · 28 Aug 2026

Garage door, both sides **£264.75**
Awaiting your answer · sent 28 Aug 2026

Approve **Decline**

Tap Approve or Decline on each item above.
Nothing extra is charged unless you approve it.

TOTAL SO FAR **£4,562.50**
Original quote + 1 approved extra

Approved extras are added to your final invoice.
Any questions, just reply to the message this link came in.

The page shows **the original quote as a single total** (never the itemised breakdown — they've already had that document), then every extra since, with **Approve** and **Decline** buttons on the ones still waiting. The total at the bottom is the original quote plus the extras they've said yes to — pending ones aren't in it, so the figure is never a bill for work they haven't agreed to.

A few things worth knowing:

- **Their answer comes back to you.** Tap **Check answers** on the card, or just reopen the job — the app pulls their taps in and sets the line's status for you, with a note saying it came from the link. If *you* already recorded an answer by hand, yours stands: the person who was there wins.
- **Nothing goes to Xero.** This is entirely separate from **Send variation quote to Xero** below it. Approved extras still reach Xero the usual way — as lines on the final invoice.
- **Prices are frozen once they answer.** Re-measure a room after the client approved that extra and the page keeps the figure they agreed to. Tapping **Send for approval** again updates the same page — it never creates a second link — and refreshes the prices only on the extras still awaiting an answer.

- **Withdrawing an extra.** Remove or unflag a variation and it disappears from their page next time you send — unless they'd already answered it, in which case it stays as the record.
- **The link is the password.** Anyone with it can see this job's totals and answer its extras, so treat it like the quote itself. It's specific to one job and doesn't expire.
- **What the client can reach.** The link only opens that one job's page. But it's the same web address the app runs on, so if someone trims the link back to the domain they land on the app's front door — which is why setting the app password matters (see [Getting started](#)): with it set they get a sign-in screen and nothing else, and it costs you one login per phone, not one per opening. A custom domain makes the link read as your business rather than as a hosting provider, but it doesn't change what's behind the front door — the password does.

When the work's done, tap **Mark Completed** — the job moves on, and Home reminds you it needs invoicing until you do.

13. The final invoice

On a **Completed** job, On Site shows **Build final invoice**. The builder assembles the whole money story in one list:

- labour **as quoted** (the frozen accepted figure, not the hours it took),
- plus **approved variations** (including the ones the client approved on their own link),
- plus the **actual materials** used (from your ticked-off list),
- minus any **deposit already recorded and synced to Xero**.

Review the lines, adjust anything, then send — the app writes **one draft invoice into Xero** and marks the job **Invoiced**. You approve and send the invoice from Xero as usual, so nothing goes to the client without your say-so. Applying the recorded deposit to this invoice, once it exists in Xero, is still done in Xero.

Once a job is Invoiced, Summary shows a read-only **Job Profitability** card telling three separate stories: **Billing** (quoted vs invoiced, with a note if they differ), **Schedule** (days quoted vs days actually logged), and **Materials** (quoted materials vs the real trade cost of what was used, with your markup on materials banked as its own figure). It's reference only — nothing here feeds back into pricing.

14. Rates

Menu (☰) → **Rates** — every number the calculator uses, grouped by what it prices. A change here applies to every future calculation, and reprices any open (un-accepted) draft immediately — accepted quotes are unaffected, since **their figures are already frozen**.

Rates

The figures behind every calculated price. Business settings — day rate, markup, Xero, backup — live on [Settings >](#)

PAINT COVERAGE

How many m² a litre covers — the standard rates, the per-product overrides that beat them, and the assumed areas behind exterior litres.

COVERAGE RATES

Wall Emulsion

m² per litre — rolled

13

Spraying uplift

% extra litres when a surface's Spray toggle is on (walls off, ceiling & woodwork on by default; fitted unit has its own) — applied on top of the standard or per-product rate, one global figure rather than a sprayed rate per product

30

Ceiling Emulsion

m² per litre — un-sprayed base; rooms' Spray ceiling toggle (on by default) adds the uplift below on top

17

Gloss / Satinwood

m² per litre — un-sprayed base; rooms' Spray woodwork toggle (on by default) adds the uplift below on top

9

Mist Coat

m² per litre — thinned product

15

Panelling

m² per litre per coat — draft default, check against your usual product

8

Measure

On Site

Summary

Section	Card	What's in it
Paint Coverage	Coverage Rates	Standard m ² /litre per surface, the spraying uplift %, and per-product rates that beat the standard figure for a specific paint range
Paint Coverage	Exterior Paint Coverage & Areas	Assumed areas and coverages behind exterior litres
Labour Times	Time Rates	Minutes per m ² (or per item) for every surface, doors/frames, sills, mist, panelling, staircase parts
Labour Times	Exterior Rates	Minutes per coat for masonry, fascias, windows, doors, garage, sash extras, access uplifts
Item & Job-Type	Doors & Frames	Paintable areas per face, fire-door surcharge, ironmongery prices
Item & Job-Type	Wallpaper Rates	Per-roll rates, ceiling/staircase multipliers, minimum price, wide vinyl & mural rates
Item & Job-Type	Kitchen Rates	The full price matrix per item type × size, linear rates, carcass %, strip-original-coating minutes
Item & Job-Type	Fitted Unit / Shelving	Shelf and bay spray times, fallback areas behind fitted-unit litres
Scheduling	Scheduling	Daily overhead, schedule buffer, Work Saturdays, bank-holiday region, calendar feed

Calibrate as you go: after a few jobs, compare the logged time and actual materials on On Site with what was estimated, and nudge the time and coverage rates here. The estimates get sharper with every job.

15. Settings

Menu (≡) → **Settings**. Everything that isn't a calculation rate lives here: your business identity, pricing defaults, Xero, and backup.

On Site

Summary

Section	What's in it
Business	Your business name and logo — shown in the app header, on the sign-in screen, at the top of every quote you send and its PDF, and in the calendar feed
Pricing	Day rate, hours per day, markup %, sundries %, spray sundries bump, deposit %, commercial job adjustment, standalone-job rounding (full or half days), and how many days before an unanswered quote gets flagged
Deposits (Xero)	The bank account a recorded deposit lands in, and the account code it posts to
Xero Integration	Connect / disconnect
Materials (Xero Items)	Refresh your product list from Xero and set the default product for each role
Quote & Invoice Text	The per-job-type wording templates for quotes and final invoices
Calibration	What your finished jobs say about two of your settings — see below
Appearance	Light / Dark / Auto theme (this device only)
Backup	Export and import everything — see below

Calibration — let finished jobs correct your settings

Some of the figures behind your prices started life as sensible guesses. This card compares them against what actually happened on your last few finished jobs.

Days on site adds up the days you logged on *On Site* → *Time on site* and compares them with the days those jobs were quoted for. If you're consistently running over, the percentage is the **Schedule buffer** you should probably be padding quotes with.

Sprayed wall paint does the same for tins: on jobs where at least one room had **Spray walls** on, it compares the wall paint the estimate asked for against what you logged as used, and turns the difference into a **Spraying uplift** figure.

Three things worth knowing:

- **Jobs with nothing logged are left out completely** — not counted as zero. A job you never logged days for says nothing about how long jobs take, so it isn't allowed to. The card tells you when it has left jobs out, and why.
- **Nothing changes until you tap Adopt.** Adopting sets that one setting for quotes from now on. No quote, invoice or finished job is re-priced — accepted quotes are frozen anyway.
- **Change "Jobs to look at"** to widen or narrow the sample. Eight is a reasonable default; drop it to 3 if you've recently changed how you work.

If a suggestion says *"not enough data yet"*, it's telling you what's missing — usually that no sprayed job in the sample has its materials logged. It'll appear on its own once the data does.

The sundries % and the exterior assumed areas aren't offered here, and that's deliberate: nothing in the app tracks what you actually spend on sundries, and an exterior paint overrun could be the assumed area or the coverage rate — there's no way to tell which. Those stay your judgement call.

16. Backups

Settings → **Backup**:

- **Export everything** downloads a single JSON file containing every job, room, setting and colour. Do this regularly — Home will nag you when the last backup is getting old.
- **Import backup** restores from a file, adding to what's already there — imported jobs get fresh identities, so it can never overwrite existing data. Restoring settings is a separate opt-in on the import preview, since it's the one thing an import *can* overwrite. Backup files up to 64MB are accepted, which is far more than a full job history comes to; if anything is ever wrong with a file, the app now tells you what in plain English rather than showing a syntax error.

17. Tips & troubleshooting

The dot in the top bar is your sync status: green = everything saved to the server, amber = saving now, red = offline. If you lose signal mid-measure, keep working — changes are kept on your phone ("Offline — N changes queued on this phone") and pushed up when the connection returns; the menu's sync line confirms with "All changes synced ✓".

Opening the app with no signal. The app keeps a copy of itself on the phone, so it opens in a dead spot exactly as it does anywhere else — everything you've measured is on the phone, not fetched from the server. It has to have been opened *once* somewhere with signal first, to save that copy; if it hasn't, you'll get a short page saying so rather than the browser's "no internet" screen.

If you've had launches that hung on a blank screen in a dead spot, that's fixed as of v2.61.0. The cause was a phone showing a bar of signal with nothing actually getting through — not the same as being cleanly offline, and the app used to sit waiting on it. It now gives the network a few seconds and then opens from the phone's own copy. The same deadline applies to saving: a change made where the signal is dead is queued on the phone within seconds instead of hanging, so the dot goes red and tells you what's waiting rather than sitting on amber.

Starting a job with no signal. You can now do this too — pull up outside a house with no bars, add the job, and measure straight into it. The job is created on the phone and appears on the server when you're next in signal, along with everything you put in it. (Before v2.61.0 nothing happened when you tapped it.)

Switching jobs with no signal. A job is kept on the phone once you've opened it in signal, so you can switch between the jobs you've been working on with no bars at all and each one comes back with its own rooms, colours and materials. The last dozen jobs you've opened are kept; older ones drop off and reload the next time you open them in signal.

If you try to switch to a job this phone hasn't got a copy of, it now tells you so and stays where it is — rather than opening the job looking empty. That matters: before v2.62.0 it opened with every room gone, and anything you then measured would have replaced that job's real rooms on the server when the signal came back. If you see that message, the job is fine — the phone just hasn't downloaded it yet.

A price looks wrong? Work backwards: room Preview → Summary breakdown → Rates. The calculation is always *areas × time rates × day rate*, plus *areas ÷ coverage = litres → tins*, plus sundries and markup. One of those numbers will be the culprit — usually a coverage or time rate that doesn't match how you actually work. If the job is already **Accepted**, remember its figures are frozen — a rate change won't move it; you'd need **Amend → revision N+1** on Summary.

Xero button not working? Tokens occasionally expire for good if the app hasn't talked to Xero in a long while. Settings → Disconnect Xero → Connect Xero puts it right in under a minute.

Sent a quote, then client wants changes? Just edit the rooms and hit **Update quote Q-nnn in Xero** on Summary — same quote number, new figures.

Materials you added by hand not in the total? Check the row's tag on Summary's materials list. A line tagged **Tracking only** is deliberately left off the quote — tap the tag to make it **Chargeable** and it joins the subtotal, the Xero quote and the deposit straight away. The card also prints *"Tracking only — not on the quote"* with a figure whenever anything on the list isn't being billed, so you can see at a glance whether money is sitting outside the price. (Lines added before September 2026 may have been saved as tracking-only by default — one tap each puts them on.)

Extra work mid-job? Always add it as a **Variation** rather than editing the accepted rooms — the original quote stays honest, and the extra shows separately on the final invoice where the client expects to see it.

Recording a deposit but the option's greyed out? A linked Xero contact is required before you can sync to Xero — the app will point you at Sync to Xero on the client details. You can still record the deposit locally in the meantime.

The build number at the bottom of the ☰ menu is how you check a new version has actually reached your phone after a deploy.

Manual for NH Estimator v2.69.4. Screenshots taken from the app with example data.

*Keeping this manual up to date: edit this file, then run `npm run build:manual` to regenerate the PDF edition (*NH-Estimator-User-Manual.pdf*) and commit both together. The cover picks up the app version and date automatically.*
